

A Convenient Lie: Global Warming & Pole Shifts

By Chris Thomas

We have all seen the increasing number of newspaper articles where the scientists and climatologists, who were the main protagonists of “man-made” global warming, withdrawing their research and claiming that governments misquoted them. The outcome being that there is now a great deal of doubt over whether the world is warming up, man-made, or not. Most of the arguments have been used to back up the Oscar winning film by Al Gore called “An Inconvenient Truth”. This film is now part of UK school curriculums for children over the age of eleven. In 2007, a concerned parent began a court case against the British Government claiming that this film, and its supporting material taught in schools, was full of false claims. The court case eventually ended up in the High Court and was adjudged to be tantamount to propaganda as the claims made could not be substantiated by government scientists. The judges ruled on a number of points and declared that if the film was shown in schools without “balancing” material being taught along side it, the teacher could also be breaking the law as teaching propaganda is not legal (section 406 of the Education Act 1996).

So what is the real truth about Global Warming?

The climate has always changed in accordance with the amount of energy we receive from the Sun. For example, in Roman times, Britain’s climate was an average of about 3 degrees warmer than currently and the Romans were able to grow grape vines along Hadrian’s Wall. Since then, the average temperature has risen and fallen several times, sometimes warmer than now, sometimes cooler than now. Between 1000 and 1350, the average global temperatures were about one degree warmer than currently and, is known as The Medieval Warm Period. However, in about 1400, the average temperature began to drop to about one and a half degrees below current levels and, a “mini-ice age” began. This was the reason why the Thames froze over in London and the fashion for winter fayres began. The last winter fayre took place in 1850 as the temperature began to rise and the Thames no longer froze. Average global temperatures have been rising ever since.

This date of 1850 has been used as the basis of the argument that global warming is man-made as this date also coincides with a growing use of fossil fuels. If the global temperatures are rising because of the carbon dioxide from fossil fuels then, it should continue to rise as we produced more and more carbon dioxide. However, in 1995 global temperatures stopped rising and have generally dropped ever since (official figures from the Meteorological Office). This period of cooling also coincides with a reduction of the Sun’s activities (called a Maunder Minimum) which is still continuing and hence, the slow drop in temperatures. This is why all of the scientists are back-tracking on their claims – there is no evidence to support them.

So where did the claims for man-made global warming arise?

The first evidence of it being a deliberate attempt to mislead us was uncovered by researcher and presenter Ian R. Crane in a document written by the Club of Rome. This document is called “The First Global Revolution” and was written in 1991. This document outlined a plan where if humanity was made to believe that fossil fuels were responsible for global warming, a “carbon tax” could be levied which would be used to finance “The New World Order”. This is the same New World Order that every head of government, worldwide, has proclaimed for the last twenty years. In other words, carbon based man-made global warming is a deliberate hoax. This deliberate hoax is confirmed by the hundreds of emails released from the University of East Anglia’s Climate Research Unit.

I can hear you all whispering “conspiracy theory” behind the back of your hands and giggling about what I’ve said here. Except, the High Court ruling, together with the release of the emails, means that this is not a conspiracy “theory” but a conspiracy “proof”.

Always “feel” for the truth of a claim before you believe it.

But, we are likely to see temperatures rising again in the near future as the Maunder Minimum comes to an end - estimated in 2011/2012, and the Sun increases its energy output. Other changes are also to come as the Earth’s axis continues to shift to vertical (see “The Universal Soul”). This shift of axis has recently been confirmed by the Inuit peoples of Canada by their long-term observations of celestial constellations (see www.isuma.tv/). The Inuit noticed that the constellations are in a different position leading them to conclude that the Earth’s axis is moving towards the vertical.

This observation by the Inuit is also backed up by the observations of hundreds of amateur astronomers. The axis shift also accounts for the Magnetic Pole shift. The Magnetic Pole isn't actually shifting. That is staying in the same place. It is the relationship between the Pole and land masses that is changing as the Earth's axis changes. In other words, the Pole is staying put but, it is the Earth that is moving. This axis change will also bring about climate change but, it is more likely to bring about a stable climate than storms and floods.

However, this does not mean that we should abandon our obligations to the planet and to the environment. The strategies adopted by many people who took their responsibility for responsible use of fossil fuels seriously needs to continue. Don't forget that every tree cut down is a tree lost and, all coal, gas and oil used depletes the Earth's resources, as well as adding to pollution, so, we all need to continue to be aware of the impact of our actions.

Make your footprints as small as possible – carbon or otherwise.
